

Implement Client Script & UI Policy (Incident)

Problem Statement

Incident records often require consistent and accurate data entry to ensure effective triage, routing, and resolution. However, relying solely on user awareness and manual checks can lead to incomplete, inconsistent, or incorrect data being submitted. This can impact reporting accuracy, SLA compliance, and overall service quality. To address this challenge, there is a need to enforce conditional field behavior and validation directly at the user interface level. Implementing standardized UI Policies and Client Scripts helps control field visibility, mandatory status, and save-time validation, ensuring that Incident records meet defined business rules before they are submitted.

Objective

The objective of the Implement Client Script & UI Policy (Incident) project is to demonstrate how ServiceNow client-side controls can be used to enforce data integrity on Incident records. This implementation showcases how UI Policies and Client Scripts can dynamically make fields mandatory, auto-populate values, control field behavior, and prevent record submission when required conditions are not met. The solution ensures that Incidents are created with complete and valid information, improving data quality and consistency across the platform.
